MORE HIRED WORKERS, WAGE RATES LOWER

More persons were employed as hired workers on farms during the week of June 20-26 than a year earlier while farm wage rates were lower, the Crop Reporting Board reported today. However, the number of family workers was about 200,000 less than a year ago, which more than offset the increase in the number of hired workers. A little over $9\frac{1}{2}$ million people were at work on farms. Of this total, about 7 million were farm operators and unpaid members of their families.

In comparison with a month earlier, the total number of persons working on farms was up about the usual 4 percent. The number of family workers was less than a month earlier, by more than the usual percentage while the increase in the number of hired workers was greater than usual. However, the increase in the number of hired workers was the same as a year ago.

Wage rates of hired farm workers were 2 percent lower than a year earlier. The average of all rates on an hourly basis was 66.3 cents compared with 67.5 cents a year earlier. All types of rates were lower except per day with board and room and per day with house which were the same.

Farm wage rates continued the downward movement shown in April but the decrease in the quarter just past was quite small. The wage rate index, seasonally adjusted, was 505 on July 1 compared with 507 on April 1. Individual

types of wage rates, except for per day with house rates, rose from April 1 to July 1 as they usually do at this season. However, the increase was less than usual for the season.

Farm wage rates were also lower than they were a year earlier except in three regions. They remained about the same in the East North Central States and were up slightly in the Middle Atlantic and West South Central States. In the East North Central and Middle Atlantic States, wage rates in industry probably tended to hold up farm wage rates. In the West South Central States, wage rates were probably held up by more favorable crop prospects in Oklahoma and Texas than in 1953.

The wage rate level dropped from April 1 in all regions. The decreases amounted to less than a half percent in the West South Central and Pacific States. The largest decreases were a 3-percent drop in the Mountain States and a 2-percent drop in the West North Central States.

Hot, dry weather in most of the country during the week of June 20-26, made rapid progress of farm work possible. Rains in Iowa, which raised streams to flood stage, delayed work in some areas of the State. The rains and flood in southern Texas came late in the survey week and had little effect on employment.

The major jobs for the country as a whole were harvesting small grains, making hay and cultivating various crops. Small grain harvest was about over in the southern part of the country and starting in southern areas of the East North Central States. Winter wheat harvest was finished in the earlier areas of Texas and just starting in the northern High Plains. The Kansas wheat harvest was about half finished with most of the crop harvested in the South. Hay making and crop cultivation were in progress practically everywhere. Cotton hoeing and chopping were proceeding well in the South and the Southwest.

Farmers were harvesting vegetables and fruit in many parts of the country. The peach harvest in Georgia and South Carolina was well along. Early apples were being harvested in New Jersey, Maryland, and Virginia. Strawberries were being picked in Michigan, Washington, and Oregon. In California, citrus, plums, apricots, cherries, peaches, and grapes were being harvested.

The total number of persons working on farms in late June was down from a year earlier in all geographic regions except the Mountain States where there was no change and in the West South Central States where there was a small increase. The regional decreases were small with the largest drop in the East South Central States. The decline there amounted to 4 percent or about 55,000 persons.

The decreases in the total number of persons doing farm work was due to a decrease in family workers as the number of hired workers was up from a year earlier. Decreases in numbers of family workers by regions ranged from 2 to 5 percent except for the Middle Atlantic States where there was no change. As with total employment, the decrease was largest in the East South Central States. Most of the decrease was accounted for by this region and the South Atlantic and North Central States.

The number of hired workers was up from last year in more than half of the geographic areas. There was practically no change in the West North Central and Pacific States while in the New England and Middle Atlantic States there were fewer hired workers than a year earlier. The increase in the number of hired workers was greatest in the West South Central States where moisture conditions in Texas and Oklahoma were more favorable than a year ago.

For the country as a whole, the number of persons at work on farms increased from May to June by about the usual percentage. In most regions, the change from the previous month was about usual. In the West North Central States there was a larger than seasonal increase while in the Pacific States the increase was less than usual. In the East South Central States there was a small decrease in total employment compared to the usual small rise.

The number of family workers ordinarily declines during June mainly because of decreases in the South, the West North Central and the Mountain States. This year the decrease was greater than usual because of slightly larger than usual decreases in most regions and a decrease of about 5 percent in the East South Central States where there is usually little change.

The number of hired workers increased from May by a little over 600,000 persons. More than two-thirds of this increase was in the North Central and South Atlantic States. Increases were considerably larger than usual in the North Central States and a little more than usual in the New England, West South Central, and Mountain States. There were less than the usual increases in the Middle Atlantic and Pacific States.

UNITED STATES DEPARTMENT OF AGRICULTURE
Agricultural Marketing Service

DEFINITIONS AND EXPLANATIONS

Employment

Farm employment estimates of the Agricultural Marketing Service cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms. Interview surveys of farmers are used less frequently to provide bench mark data on employment. The survey week for the mailed questionnaire each month is the last complete calendar week in the month except when that week includes the last day of the month; in that case, the survey week is the next to the last full calendar week.

Employment concepts

All farm operators are counted as employed if they spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business. Members of the operator's family or household doing unpaid farm work or chores, are counted if they put in 15 hours or more during the survey week. Operators plus unpaid members of their families or household who meet these criteria of employment are called family workers. All persons doing one or more hours of farm work or chores for pay during the survey week are counted as hired workers. Members of the operator's family doing farm work for cash wages are counted as hired workers. Croppers are considered family workers when working on their own crops, but hired workers when doing farm work for pay off their own tracts. If a person is employed both as a family worker and a hired worker during the week on the same farm, he is counted as a hired worker.

Comparability with other data

The data on farm employment published by the Agricultural Marketing Service differ from those on agricultural employment published by the Bureau of the Census in the Monthly Report on The Labor Force. The Agricultural Marketing Service collects information from the employer (the farmer) who reports the number of persons working on his farm during the week regardless of the other jobs held by those workers. The Census data, on the other hand, are obtained through interviews with approximately 25,000 farm and nonfarm households with the housewife or some other member of the household reporting on the labor force status of the household members. They relate only to persons 14 years of age and over, who are in the civilian population and not in institutions.

The difference between the Agricultural Marketing Service and the Census data is attributable mainly to the different treatment of three groups of workers. Children under 14 years of age who meet the criteria

of employment are included in the Agricultural Marketing Service estimates, but not in the Census Bureau's. It is estimated that this number may reach a summer peak as high as two million. Persons working on more than one farm during the survey week are counted only once by the Census Bureau, but they are counted by the Agricultural Marketing Service on each farm where they work and meet the minimum hour requirements. This group is also more numerous during the harvest season when the demand for farm labor is greatest. The additional count of workers attributable to this duplication is estimated at a minimum of a quarter of a million and may be considerably larger. The third group is composed of persons who work in both agricultural and nonagricultural employment, but work longer at the nonagricultural employment; they are classified by Census as working on nonagricultural employment, but by the Agricultural Marketing Service as working on a farm. This last group may range from one-half million to a million in different seasons of the year.

Other groups counted by the Agricultural Marketing Service but not by the Census Bureau are imported foreign workers and some migratory workers not living in private households. On the other hand, the Census Bureau includes in its estimates of agricultural employment certain classes of workers which the Agricultural Marketing Service does not include. Persons with "nonfarm" occupations who are working on farms, such as bookkeepers and typists, some persons in certain agricultural processing activities and farm operators with no other job who did no farm work are considered as employed in agriculture by the Census Bureau, but are not included by the Agricultural Marketing Service in its estimates of agricultural employment.

Because the volume of agricultural employment is affected by changes both in season and in weather, the difference in the week of the month for which the data are collected may also make some difference. The Agricultural Marketing Service data relate to the last full calendar week ending at least one day before the end of the month while the Census Bureau information relates to the week containing the eighth of the month.

The Agricultural Marketing Service estimates farm employment from current reports made by a selected group of farmers adjusted to enumerative survey bench mark data. The Bureau of the Census bases its figures on a sample of dwelling units. Accordingly, the figures in both cases are subject to a sampling variation and may differ from the results of a complete census.

Wage rates

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality. The "at this time" on the average probably represents the second or third day before the end of the month.
